

VK-51SE

Balanced Preamplifier

Balanced Audio Technology is pleased to introduce our newest reference preamplifier in the **VK-51SE**, a evolutionary follow-up to the industry acclaimed VK-50SE. The VK-51SE makes substantial improvements to its power distribution system with a completely revised SUPER-PAK, that uses oil-capacitors for power supply bypass. These augment an extensive use of film capacitors employed in the same area. The result is a smoother response from top-to-bottom over the already stellar performance of the VK-50SE. Moreover, the power supply energy storage of the VK-51SE is now increased to over 325 joules. This is an almost insane level of energy storage for a preamplifier, but then you'd expect nothing less from BAT in their reference class preamplifier.

The result of these upgrades is that the VK-51SE offers a greater degree of dynamic performance than the standard-setting VK-50SE. Those who've listened to the VK-50SE in a well set-up system will appreciate that this is no small feat.

And yes, the VK-51SE also incorporates the same fresh look that was recently introduced in Balanced Audio Technology's VK-300x integrated amplifier. Most importantly, all VK-50SE (as well as VK-50) preamplifiers can be fully upgraded to the VK-51SE. If you're a BAT aficionado, you'll want to have the VK-51SE in your system as soon as possible! If you're a skeptic, please compare the sound, industrial design, and user-interface of our special edition preamplifiers to any competitive offering. We're confident that you'll find the VK-51SE a compelling statement of high-end performance and modern audio design!
